Description

Most organizations find out about a damaging public narrative only after it has already gone viral, when any response looks reactive instead of thoughtful. A.E.G.I.S is a working OSINT and security intelligence platform I built end-to-end, FastAPI and Celery on the backend, Next.js on the frontend, PostgreSQL with pgvector for entity storage, running IndoBERT sentiment analysis on Indonesian text, entity graph mapping, and live integration with Wazuh SIEM for host-level security correlation, alongside a set of OSINT reconnaissance tools, all built to stay within legal and platform boundaries, no paid APIs, no access bypassing. I'm building this alongside a Cyber Security course I'm currently taking. Every module is functional today, IndoBERT runs on real Indonesian text and Wazuh correlates real security alerts, not a mock, though the scraping pipeline feeding the sentiment engine is still the weakest link. The gap I kept noticing is that a Relationship Officer or Relationship Manager usually finds out about reputational damage only after it's already viral; A.E.G.I.S is meant to surface critical issues while they're still contained, giving that person lead time to plan a proportionate response instead of reacting under pressure. Working on this taught me that sentiment is a direct reflection of public identity, and that this project sits at the intersection of customer relationship management and data mining, not just OSINT.
