Description

After finishing a run, most people want to share it, but Strava's own share cards feel clinical, more like a spreadsheet than something worth posting. Affterun connects to Strava via OAuth, pulls real activity data, distance, pace, duration, elevation, and lets the user overlay it onto their own photo, styled into one of three cinematic or editorial poster presets, then exports it as a high-quality PNG built for Instagram Story. The architectural decision I'm most proud of is that it's entirely client-side, no backend, no database, no server ever touches the user's photo or Strava token, which shaped the privacy policy itself: the app is structurally incapable of collecting personal data. It's live at affterun.vercel.app, with poster generation, cropping, and export fully functional, while the Strava integration currently runs in single-user mode pending Strava's public API approval. What I learned building this wasn't really technical, cropping photos and rendering HTML into a PNG both turned out easier than expected, existing libraries handled most of it. The real challenge was the idea itself, deciding what a poster should actually look like, and realizing that picking a stack is rarely the hard part anymore, knowing what you're trying to make in the first place is.
