Description

Field sales teams at an FMCG distribution business were essentially invisible once they left the office, with sales numbers only reaching the owner after slow manual compilation, often too late to act on a slowing region. I built a Progressive Web App where sales staff check in at each store using GPS, verified with a watermarked photo, logging products sold in that same visit, feeding a real-time dashboard with role-based access across 5 permission levels. The database started at just 5 tables for a simple tracking tool, but as real usage exposed new requirements, multi-warehouse stock, route scheduling, I redesigned it into 14 tables and migrated over 21,000 historical records without losing a single one, applying a principle from my IT Project Management coursework: redesign what exists rather than rebuild from zero. Since going live, the system has recorded 3,064,300 units sold across 23,527 field visits over seven months, with a 45.3% store conversion rate, now running across 2+ regions. The hardest part wasn't the GPS or the dashboard, it was designing a system that field sales couldn't quietly work around, a watermarked photo and a location check aren't really features, they're how you turn "trust me" into something a system can actually verify.
