Introduction to the Architecture Development Method

Module 3

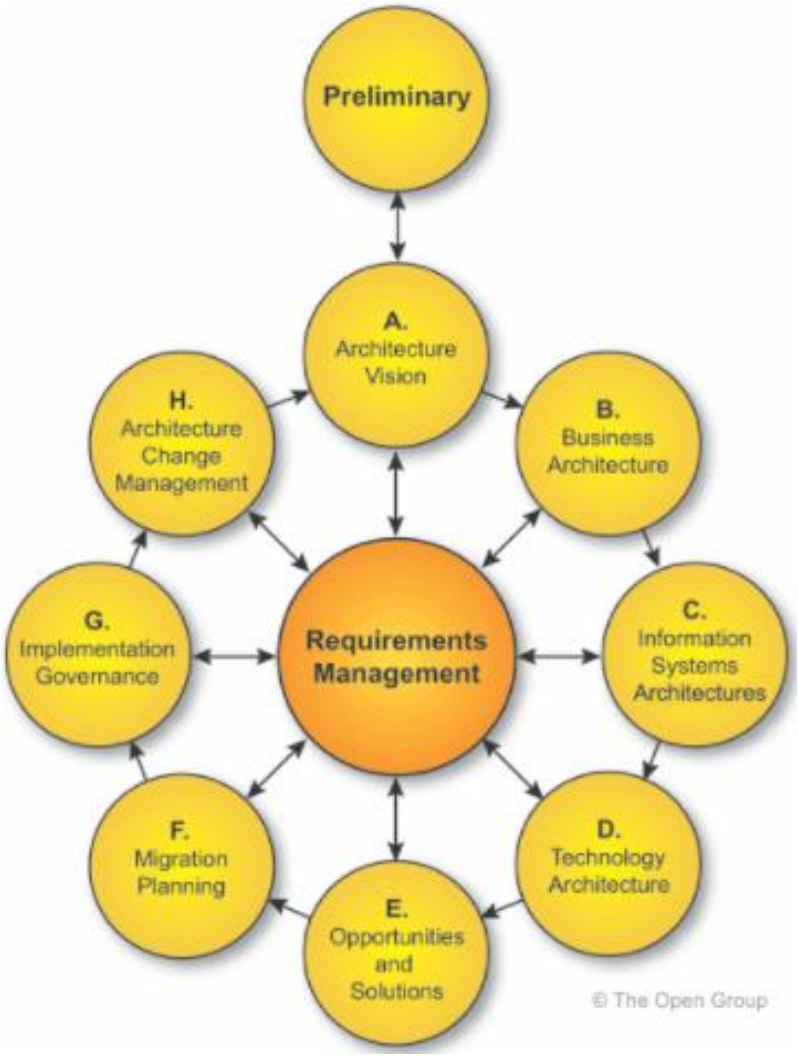

Module Objectives

- The TOGAF ADM
- Its relationship to other parts of TOGAF
- The phases of the ADM
- How and why to adapt the ADM
- How to scope an architecture activity
- The need for an integration framework

What is TOGAF ADM?

- The ADM forms the core part of TOGAF
- The result of contributions from architecture practitioners
- A process for developing an EA
- Integrates all the elements within TOGAF
- Designed to address business and IT needs through
  - A set of architecture views
  - A set of recommended deliverables
  - A method for managing requirements
  - Guidelines on tools for architecture development

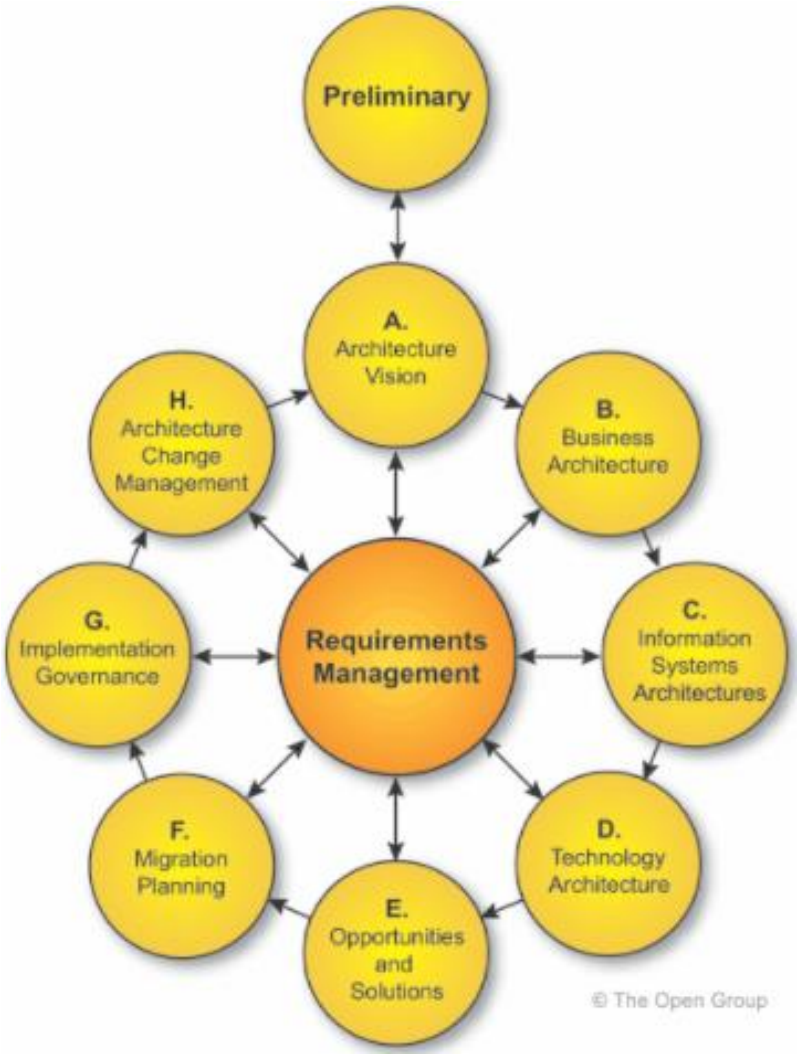

ADM - Process

- The ADM is an iterative process
  - over the whole process
  - between phases
  - within phases
- For each iteration, re-consider
  - Scope
  - Detail
  - Schedules, milestones

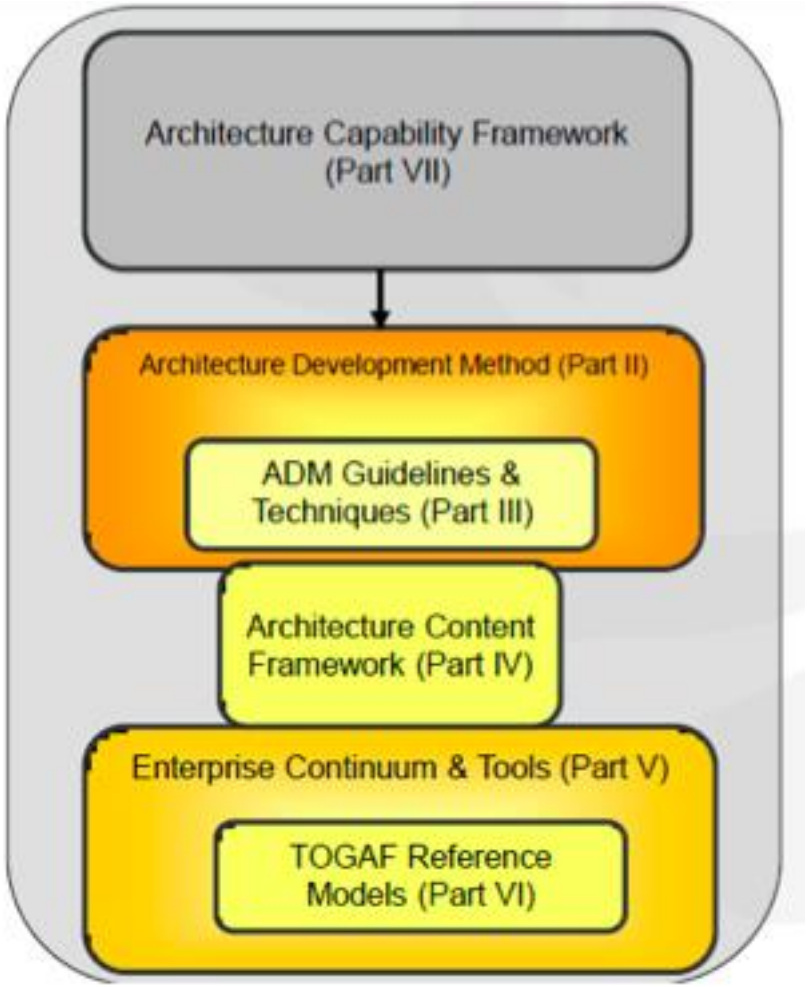

THE Open GROUP

ADM - Process

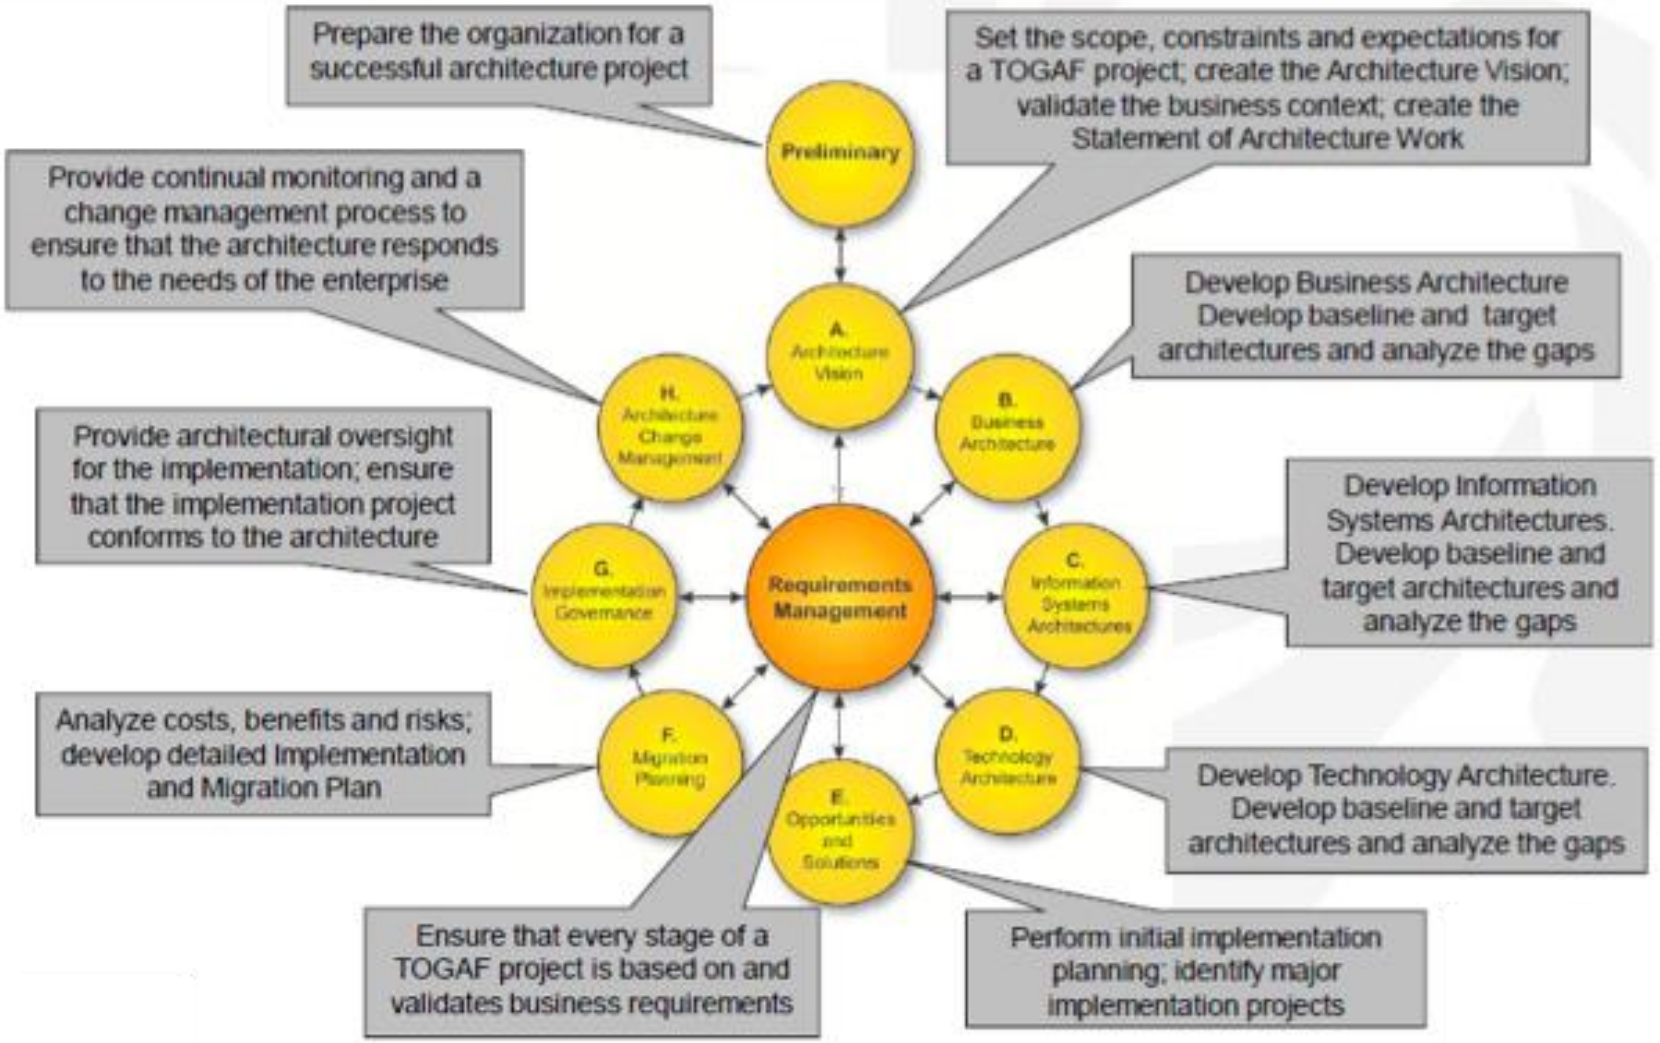

- Consider assets from:
  - Previous iterations
  - Marketplace, according to availability, competence and value
  - Other frameworks
  - Systems models
  - Vertical Industry models

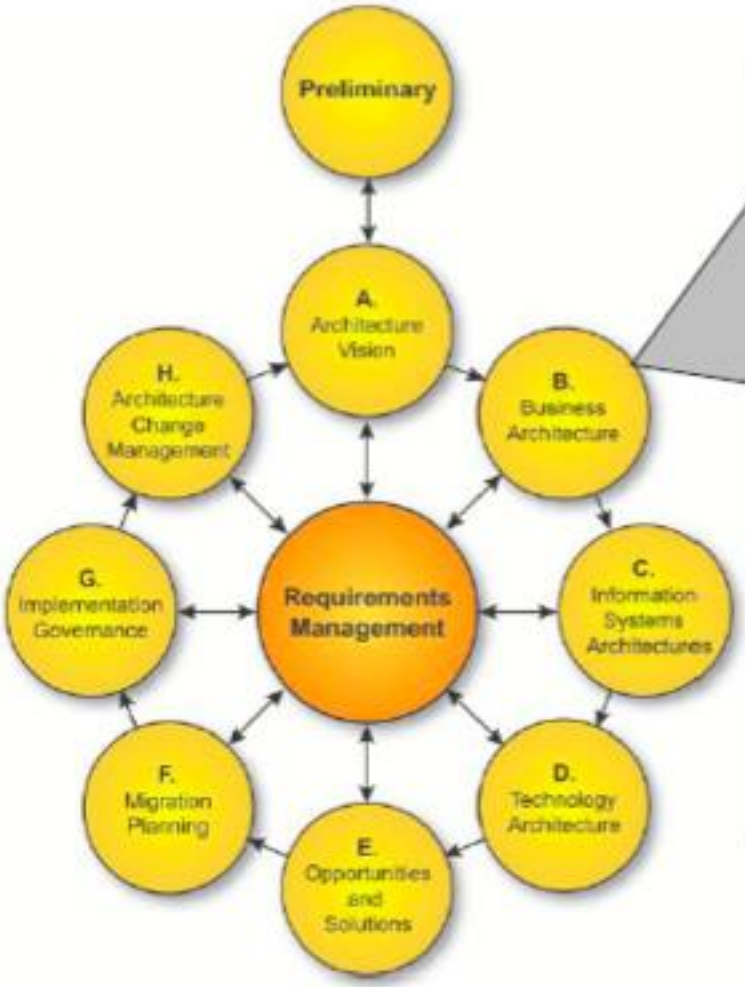

Relationship to other parts of TOGAF

ADM Phases

Prepare the organization for a successful architecture project
Preliminary
Set the scope, constraints and expectations for a TOGAF project; create the Architecture Vision; validate the business context; create the Statement of Architecture Work
Provide continual monitoring and a change management process to ensure that the architecture responds to the needs of the enterprise
A. Architecture Vision
Develop Business Architecture Develop baseline and target architectures and analyze the gaps
H. Architecture Change Management
B. Business Architecture
Provide architectural oversight for the implementation; ensure that the implementation project conforms to the architecture
Develop Information Systems Architectures. Develop baseline and target architectures and analyze the gaps
G. Implementation Governance
Requirements Management
C. Information Systems Architectures
Analyze costs, benefits and risks; develop detailed Implementation and Migration Plan
F. Migration Planning
D. Technology Architecture
Develop Technology Architecture. Develop baseline and target architectures and analyze the gaps
E. Opportunities and Solutions
Ensure that every stage of a TOGAF project is based on and validates business requirements
Perform initial implementation planning; identify major implementation projects

ADM Phase Steps Example

The order of the steps should be adapted to the situation.

In particular you should determine whether it is appropriate to do the Baseline Business Architecture or Target Business Architecture development first

Steps

1. Select reference models, viewpoints, and tools
2. Develop Baseline Business Architecture Description
3. Develop Target Business Architecture Description
4. Perform gap analysis
5. Define candidate roadmap components
6. Resolve impacts across the Architecture Landscape
7. Conduct formal stakeholder review
8. Finalize the Business Architecture
9. Create Architecture Definition Document

ADM Inputs and Outputs

- TOGAF defines a number of inputs and outputs for each phase
  - These are suggestions, therefore **not mandatory**
  - Output of an early phase may be modified in a later phase
  - Version numbers are used to manage the output
  - A convention is used to illustrate the evolution of deliverables
    - 0.1 – a high level outline deliverable
    - 1.0 – a formally reviewed detailed deliverable

Adapting the ADM

- **Generic methodology** intended for various enterprises
- Usable with deliverables of other frameworks such as Zachman, DODAF, …
- It is usual to modify or extend the ADM to suit specific needs

Governing the ADM

- ADM is a key process to be managed and governed
- The **Architecture Board** should be satisfied that the method is being applied correctly
- The management of all architectural artifacts, governance and related process should be supported by a controlled environment such as a repository, **Architecture Repository**

Governance Repository

- Reference Data
  - Used for guidance and instruction during project implementation.
- Process Status
  - All information regarding the state of any governance processes will be managed
- Audit Information
  - All completed governance process actions

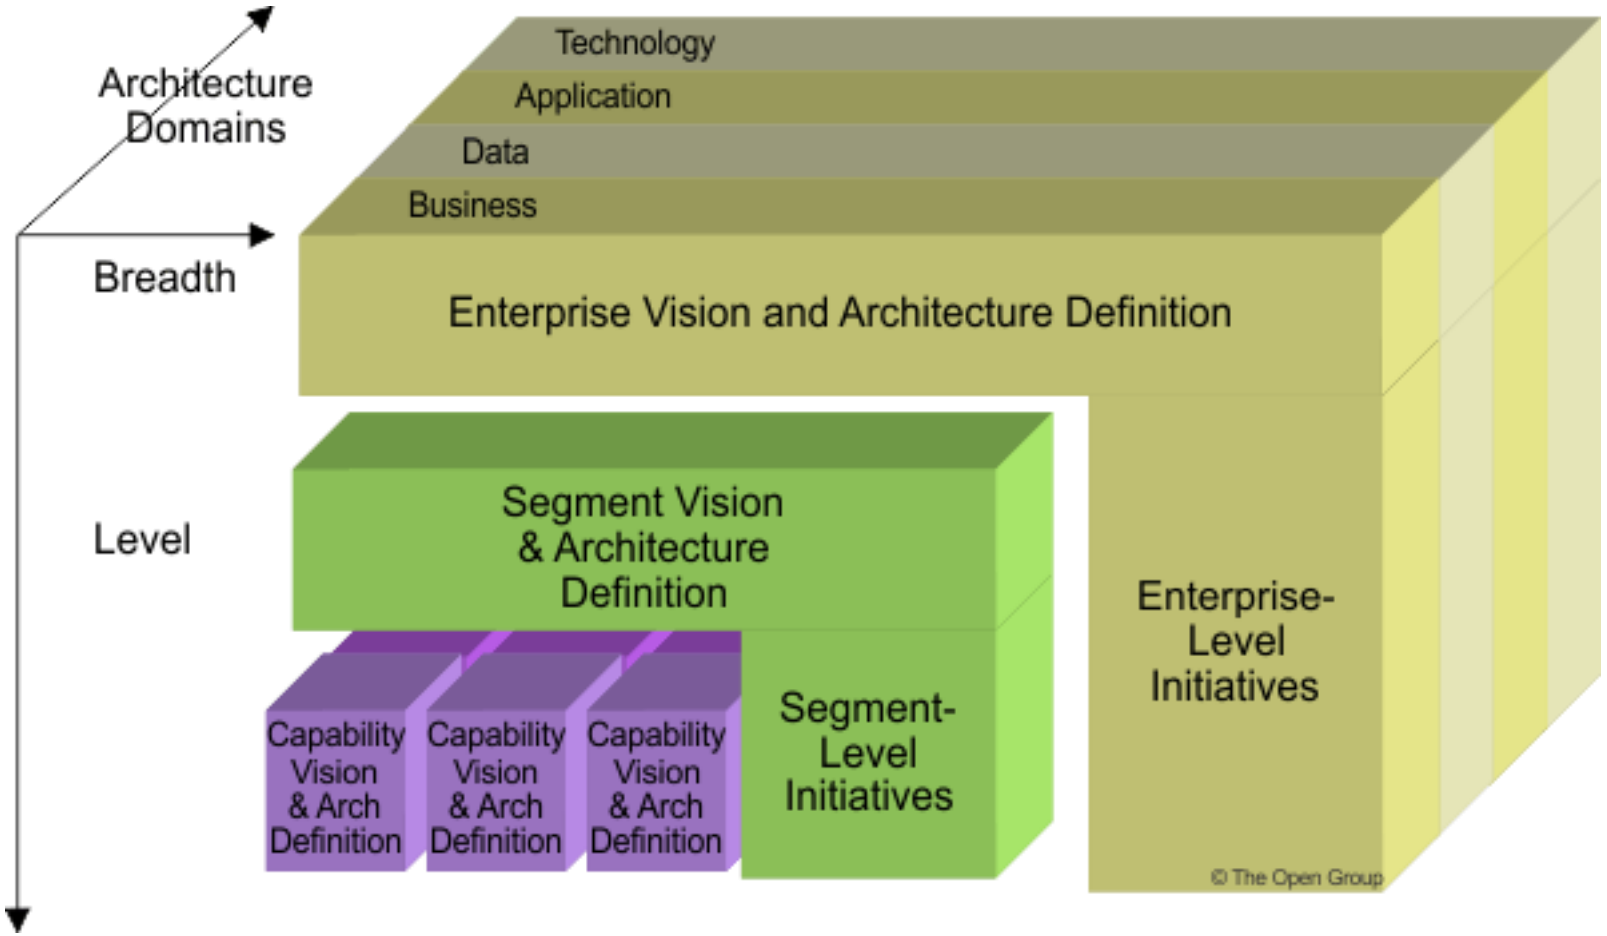

Reasons to constrain the Scope of Architectural Activity

- The organizational authority of the team producing the architecture
- The objectives and stakeholder concerns to be addressed within the architecture
- The availability of people, finance, and other resources

Scoping the Architecture Activity

- There are four dimensions in which scope may be limited
  - Breadth
  - Depth (Level)
  - Time Period
  - Architecture Domains

Architecture Integration

Summary

- The ADM is comprehensive, general method
- ADM recommends a sequence for various phases and steps involved in developing an architecture
- ADM is an iterative method
- ADM draws on the other parts of TOGAF for assets and processes
- ADM can be used with other deliverables from other frameworks
